Comments on Project I

- Except one report, all received reports show a good level of understanding
  - Statement of the question
  - Model construction
    - Coordinates transformation (2D  $\leftrightarrow$  3D)
    - Assignment of values on the 2D plane
    - Discussion on interpolation techniques
  - Experiments (model verification)
    - Data sets
    - Show image outputs
- Improvements
  - Implementation (“just do it”, Matlab programming)
  - 3D geometry (coordinate systems)

---

---

---

---

---

---

---

---

Sample Report 1

- Good write-up
- Good code
- Experiment with real data
- Needs more experiments on various data sets

---

---

---

---

---

---

---

---

### Linear Algebra

- View a matrix as an “array of columns”:  
 $A_{m \times n} = [\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_n]$  with  $\mathbf{a}_i = [a_{1i}, a_{2i}, \dots, a_{mi}]^T$
- If  $\mathbf{x} = [x_1, x_2, \dots, x_n]^T$ , then  $A\mathbf{x}$  can be viewed as a linear combination of the columns of  $A$ :  
 $A\mathbf{x} = x_1\mathbf{a}_1 + x_2\mathbf{a}_2 + \dots + x_n\mathbf{a}_n$
- A matrix is symmetric if  $A = A^T$
- A matrix is orthogonal if its columns are orthogonal vectors:  $\mathbf{a}_i^T \mathbf{a}_j = 0$  for all  $i \neq j$ ;  $\mathbf{a}_i^T \mathbf{a}_i = 1$

---

---

---

---

---

---

---

---

### Important Theorems

- Theorem 1: If  $A_{m \times n}$  is an orthogonal matrix ( $m \geq n$ ), then  $A^T A = I_{n \times n}$
- Proof. Let  $A = [\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_n]$ . Since  $A$  is orthogonal,  $\mathbf{a}_i^T \mathbf{a}_j = 0$  for all  $i \neq j$ ;  $\mathbf{a}_i^T \mathbf{a}_i = 1$   
 Now, the  $(i, j)$  entry of  $A^T A = \mathbf{a}_i^T \mathbf{a}_j = \delta_{ij}$ .  
 So,  $A^T A = I$ .
- Theorem 2.  $A^T A$  and  $A A^T$  are symmetric matrices.

---

---

---

---

---

---

---

---

### Important Theorems, cont'd

- Theorem 3. A matrix is symmetric if and only if it is orthogonally diagonalizable.
- $A = A^T \leftrightarrow A = U D U^T$ ,  $U$  orthogonal,  $D$  diagonal
- Eigenvalue and eigenvector:  $\lambda$  is an eigenvalue of  $A$  if for some vector  $\mathbf{v} \neq \mathbf{0}$ ,  
 $A\mathbf{v} = \lambda\mathbf{v}$ .  
 We call  $\mathbf{v}$  an eigenvector of  $A$  associated with eigenvalue  $\lambda$ .
- Theorem 4. A symmetric matrix is diagonalized by a matrix of its orthogonal eigenvectors.

---

---

---

---

---

---

---

---

### Important Theorems, cont'd

- Theorem 3. A matrix is symmetric if and only if it is orthogonally diagonalizable.
- $A=A^T \leftrightarrow A=UDU^T$ , U orthogonal, D diagonal
- Eigenvalue and eigenvector:  $\lambda$  is an eigenvalue of A

Formed by eigenvectors       $U^{-1}AU = D$       Formed by eigenvalues

$$Av = \lambda v.$$

We call  $v$  an eigenvector of  $A$  associated with eigenvalue  $\lambda$ .

- Theorem 4. A symmetric matrix is diagonalized by a matrix of its orthogonal eigenvectors.
